stalic acids
Claim 33, Page 45, 60pp; English
Claim 33, Page 45, 60pp; English
The [Asn]69 analogue was constructed to add an N-glycosylation site
at Asn69 (amino acid 96 in this sequences) and was produced by
CC expression of DNA obtained by site-directed mutagenesis of DNA
cencoding EPO. The analogue has a higher sialic acid content than
chuman EPO and has increased biological activity.
CC It can be used to treat mammals to cause bone marrow cells to
increase prodn. of reticulocytes and red blood
CC thereby increasing haematocrit levels.
CS See also R11891-93.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

ö

THE PETTHELIAL COMPARTMENT OF THE PRONEPHROS AND MESONEPHROS.
-!-ALTERNATIVE PRODUCTS: MANY DIFFERENT FORMS OF THIS PROTEIN
ARE PRODUCED BY ALTERNATIVE SPLICING OF THE LD GENE. A
VARIATION IN SPLICING IS SEAR AMONG DIFFERENT TISSUES AND
DIFFERENT SIZE TRANSCRIPTS EXIST WITHIN ANY ONE TISSUE.

NUCLEAR PROTEIN; DEVELOPMENTAL PROTEIN; ALTERNATIVE SPLICING.

W SEQUENCE FROM N.A.

J. BIOL. CHEM. 266:8203-8213(1985).

-!— FUNCTION: GLIADIN IS THE MAJOR SEED STORAGE PROTEIN IN WHEAT.

-!— FUNCTION: GLIADIN S THE MAJOR SEED STORAGE PROTEIN IN WHEAT.

-!— FUNCTION: GLIADIN S THE MAJOR SEED STORAGE PROTEIN IN WHEAT.

-!— THE ALPHA/BETA-GLIADINS CAN BE DIVIDED INTO 5 HOMOLOGY CLASSES.

SEQUENCE DIVENCENCE BETWEEN THE CLASSES IS DUE TO SINGLE BASE SUBSTITUTIONS AND TO DUPLICATIONS OR DELETIONS WITHIN OR NEAR DIRECT REPEATS. THERE ARE MORE THAN A 100 COPIES OF THE GENE FOR ALPHA/BETA-GLIADIN PER HAPIOID GENOME.

DR FIRE, E22364; E22364.

KW SEED STORAGE PROTEIN, REPEAT; SIGNAL; MULTIGENE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ore 107; Match 32.8%; QryMatch 4.0%; Pred. RESULT

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for the produ. of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr= 114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence was derived from the DNA encoding natriuretic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors

New oligo:nucleotide probes specific for Mycobacteria - used for
                                                                                                                                                                                                                                                                             but
                                                                                                                                                                                                                                                Claim 3; Page 14; 23pp; English.
Oligomocleotide probe MK14-A consists of nucleotides 5-95 of N (QS1735). It hybridized to all spp. of mycobacteria tested, pcross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. See also QS1735-45 and QS1747-59.

                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              possible nucleotide positions within a specified region. The variable 3' ends generated in this way are used as primers for reverse transcriptase. Nucleotides are misincorporated by the
                                                                                                                                                                                                                                                                        (Q51735). It hybridized to all spp. of mycobacteria tested, cross reacted to a few non-mycobacterial spp. The probe may be useful as an initial screen for mycobacterial infection. Compared with interferon beta preped by recombinant methods, the INFs of the invention are more active and have different affinities for cell surface receptors (allowing selective targetting); they have higher therapeutic index; improved stability against microbial breakdown during synthesis; and better in vivo solubility and home/pandya/spector252491/US-08-252-491-18 mg stability. They are also easier to recover from incubation mixts. Plasmid pCisEBON (a pRK5 derivative) is an episomal CMV driven
Prespression plasmid. HuHGF variants with enhanced receptor binding
activity were produced by site-directed mutagenesis. Stable
populations of preferred HGF variants were obtained by transfecting
human embryonic kidney 293 cells and then these were subcloned in
pCisEBON. See R52940-R52949 for examples of pref. HGF variants.

Claim 1; Page 2; 13pp; Japanese.
This sequence encodes a novel envelope region of type C hepatitis virus (HCV). This fragment can be used for the preparation of a vaccine for hepatitis C. This fragment was prepared from the serum of non-A, non-B hepatitis patients and the envelope region DNA was amplified by PCR using the primer sequences given in Q35073-76. Sequence 565 BP; 61 A; 92 C; 106 G; 85 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             435 ctmbmcymgsmdgyaygdgarrdyrcargrytgyaaytgytcdmtytayscy 486

Location/Qualifiers

Anti-proliferative and immune regularing actions claim 28; Chart 29, page 38; 71pp; English. Compared with interferon beta prepd. by recombinant methods, the INFs of the invention are more active and have different affinities for cell surface receptors (allowing selective targetting); they have higher therapeutic index; improved stability against microbial breakdown during synthesis; and better in vivo solubility and stability. They are also easier to recover from incubation mixts. Sequence 501 BP; 112 A; 31 C; 69 G; 79 T;	2800000000

Mean 11.201; Variance 3.962; scale 2.827 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The B95-8 genome (V01555) has a large deletion in the right side of
Sequence and transcription of Raji Epstein-Barr virus DNA spanning
the B95-8 deletion region
Virology 179 (1), 339-346 (1990)

particular region taking into account the adjacent longest frames and likely transcription signals. Note that on this basis some long

overlapping frames have been excluded and on the other hand some

small frames have been included which might represent exons or

features or because of some other experimental data. The reading

genes because they occur in a logical combination with other

frames are named according to the Bam H1 fragment in which they start. eg BALF3 is the third leftward frame starting in Bam H1

If there is an obvious TATA sequence followed by an in frame Met

ragment A. BORF1 is the first rightward frame in Bam H1 fragment

from the A of the ATG to the base preceding the termination codon If there is no obvious initiation codon or there is a substantial reading frame in phase before the ATG then the reading frame is purine at -3 and/or a G at +4 then the reading frame is numbered codon that satisfies the rules of Kozak [12] in that there is a numbered from the first base of the first codon.

### SITEs of POLYA signals

This feature lists all occurences of the sequence AATAAA which is found normally approximately 20 bases upstream of the mRNA processing/polyA addition site. The rarely used homolog ATTAAA is only listed when it is found in a position close to the end of a major reading frame

## SITEs of DONOR and ACCEPT sequences

sequences and only This is not a comprehensive listing of all such sequences and only the positions of a few have been noted because they occur in potentially interesting positions. The number quoted in the table the position of the terminal base in the intron in each case.

## Restriction enzyme SITEs.

Only the positions of the sites Bam HI (BAM) are listed.

## /home/pandya/spector252491/US-08-252-491-18 rge Sep 28 00:04

DNA sequence of B95-8 EBV has been revised [19]. The original entire sequence, position 1 has benn moved 1 base to the left of the EcoRI site separating EcoRI Dhet from EcoRI I (Baer et al, 1984) base 359 has been deleted so the new sequence around that position reads TCAGTCTTT. To avoid renumbering the (ie the first A of AGAATTC).

#### gives 4.1kb late RNA. Probably encodes non glycosylated 140kd protein in membrane antigen. Also two latent RNAs spliced underneath this RNA, lengths 1.8 and 2.0kb (Hudson et al, 1985). The longer one encodes terminal protein." 1736.5692 'note="TATA: TATTAAA BN-R1 late promoter before BNRF1, 'note="BNRF1 reading frame, 5 NXT/S; NCBI gi: 59075" /note="exon 2 terminal protein RNA" /note="exon 3 terminal protein RNA" 'note="exon 4 terminal protein RNA" protein RNA" protein RNA" /note="exon 8 terminal protein RNA" 1676 protein RNA /organism="Epstein-Barr virus" /note="polyA signal: AATAAA" /note="exon 5 terminal 'note="exon 7 terminal /note="exon 6 terminal /note="TATA: TATAAAG" 1691 'note="TATA: TATAAAT" 'note="TATA: CATAAAA" Location/Qualifiers /strain="B95-8" complement (1192) complement (1383) complement (535) 1026..1196 1280..1495 1574..1682 360..458 540..788 871..951 NCBI gi: 59074 misc_feature promoter promoter promoter promoter source RNA **mRNA** mRNA **mRNA** mRNA mRNA mRNA CDS FEATURES
